The Oxidher rusting system is one of the world fastest oxidation way, with an unbeatable adherence whatever support type.

Able to convert in a while a simple surface into aged object with rust effect. It's a very decorative system with a great variety of rust colors easily adaptable to different places and styles

It's composed of a resin, iron powder and three activators, so depending on which of them is applied, the system will oxidize in red, blue or green color  
It's recommended both for exterior and interior uses and can be applied on all types of supports: metal, wood, cement, walls, ceramics, etc.

1°Format:0,500L(1,5kg)Steel+1L(0,5kg)Resin  
2°Format:2L(6kg)Steel+4L(2kg)Resin  
3°Format:5L(15kg)Steel+10L(5kg)Resin  
Activator:250ml/1L

## APLICACIÓN

We'll start with the preparation of the mixture, pouring the steel grains over the resin while stirring with a spatula until getting a homogeneous product without lumps.  
Following will be applied the mixture with a trowel or brush on the desired surface

Then proceed to the realization of the rust effect. For this we have 3 different activators depending on the tonality we want to obtain: Red Activator, Green Activator and Blue Activator.

### *ActivatorRed*

Apply a first coat with the spray over the yet wet surface of steel grain coat.  
It is possible to apply a second coat over the already dry surface to intensify the effect; always applying Activator Red over the Activator Red of the first coat (Red + Red).

### *ActivatorGreen*

Instead using the red Activator, apply a first coat with the spray over the yet wet surface of steel grain coat. It is possible to apply a second coat of the Green Activator with the former coat already dry in two different ways:

Either applying over the first coat created with the Green Activator to intensify the effect (Green + Green), or applying over the first coat created with the Red Activator to obtain different effects (Red + Green)

### *ActivatorBlue*

It will be applied spraying only as a second or third coat over the already dry former surface. We can't use it as a first coat. We can use it Blue over Red (Red + Blue) or Blue over Green (Green + Blue) and even as a third hand, creating multiple combinations.

Finally, once the surface is already oxidized and completely dry we will protect it with the Oxide Sealer.
